

MJD waveform amplitude and residual noise versus energy

All 410 clean test events in detector 133, run 50928; no waveform-shape selection

Blue: lowest energy quartile | Gray: middle half | Orange: highest energy quartile

The leading pulse amplitude is removed by preprocessing, but relative baseline noise can still encode energy.

RMS uses samples 0-199. This descriptive proxy is not a classifier score or proof that a trained model uses energy.
